

Fiber Science

Our Fiber Science Team uses a variety of techniques and microscopes, capturing a product's fibers in intricate detail. Then our staff takes over with trained eyes and expertise to identify and interpret the samples.

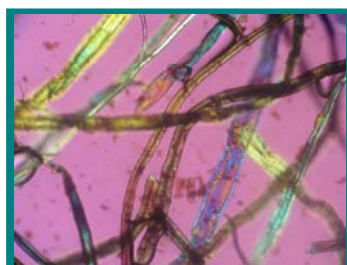

IPS's microscopic fiber analysis is the best means of identifying and verifying raw material or finished product. Our analysis proves itself again and again, solving problems in manufacturing, troubleshooting, and forensics.

Our Fiber Science experts will identify hardwood/softwood ratios through fiber analysis.

Additionally, species analysis can determine species ID and percentages.

IPS's Fiber Science Team also offers some of the finest stains available, at low prices.

A paper mill was concerned about the rejection of its paper by a customer...

Upon investigation of the returned paper, the mill found that the paper appeared to be their product, but noticed unusually low test values. A sample was submitted to our Fiber Lab at Integrated Paper Services for fiber analysis.

Putting their years of fiber analysis experience to work, our team of specialists at IPS thoroughly examined the rejected paper. Their analysis proved that the rejected paper had been produced by a different mill. The customer had returned the paper to the wrong mill.

Call the IPS Test Experts at IPS for quick solutions for your paper mysteries.
